Q: Problem of regression analysis in my SPSS version I'm a second year statistics student and I'm working on an example of a regression analysis using SPSS. The problem is that the example I've been given doesn't work with my version of SPSS. I have the example of regression analysis here: (p.16) In this example, the author describes that the relationship between two random variables was of the form $X = a + bY$. Now, I have the dataset: But when I run the regression analysis, it says that it's not working with my version of SPSS, and it has several errors. This is the error code: Error code: syntax error (157) Error code: wrong data type for expression (85) Error code: cannot extract the stored value from a variable of the type used for the indexing (160) It's pretty clear to me that the problem is with the syntax of the equation. But I cannot find the answer to this problem. I thought it might be my version of SPSS, but if you run the same regression example in different SPSS versions, it will work with different ones. So, the question is, how do I correct the syntax of the regression model so that it works with my SPSS version? A: As D Knuth wrote in his Programming pearls: The natural mistake is to try to do a bit of programming in a non-programming language. The problem is that SPSS is not a programming language; it is a collection of tools. It should be treated as a package of helpful tools, rather than a piece of software that can be edited. He also wrote this in his Letter to Professor Barker: We often encounter the problem of people beginning to write programs in a programming language, and getting very confused and mired in it. They use SPSS as if it were a programming language; they use some statement in S
