1. Supports SharePoint 2010, 2013 and 2016. 2. Convert EML to MSG or MSG to EML. 3. Includes multiple templates to achieve the best formatting results. 4. Exposes an API that can be used to manipulate and extract text from documents. 5. Supports document encryption. 6. Works on the OS platform. 7. Receive emails from different external email providers. 8. Supports multiple languages. System.Net.Mail is a useful.NET component that helps to send e-mails. This component offers a few methods to send an e-mail message. When you use System.Net.Mail, the message is sent via a TCP/IP connection. You do not have to worry about the Internet or Local Area Network, because this component uses the services of the OS to send messages. In this tutorial you will see how to send an e-mail message using the System.Net.Mail, using the E-MailMessage, MailMessage and SmtpClient classes. System.Net.Mail Description: System.Net.Mail is a popular.NET component that is already integrated with the.NET Framework and enables developers to send e-mail messages to the.NET Framework. The System.Net.Mail component is a great alternative to the standard.NET SmtpClient and can be used as an add-in for the.NET Framework's regular SmtpClient. The SMTP server is a mail server that is used to send email messages. A mail server is a server that is responsible for accepting incoming messages. The SMTP server is a core part of the email delivery process. You can configure this component using the SMTP server settings that appear in the app.config file. Aspose.Net for.NET Description: Aspose.Net for.NET is a.NET platform-independent component library. Developers can use the Aspose.Net for.NET components to integrate their applications with Microsoft Office documents and XPS documents. The Aspose.Net for.NET component library offers a lot of advantages to the developer. For example, it allows you to send emails by using the available components. The SMTP component is the ideal component for this task. It is a component that takes care of the process of sending emails. You can use this component to integrate an application with the Aspose.Net SMTP server. Aspose.Text.RegularExpressions.Regex is a handy component that

Email Transformations — In Aspose.Email, transformation refers to the procedure of formatting or changing the body of an email message. Through this feature, you can convert EML and MSG emails into any other supported file format. Create/Update/Delete Email messages — You can create, update and delete emails in Aspose.Email for SharePoint. You can also perform different actions in a single email based on the type of email being converted. Email Images — Images can be added to any email message in Aspose.Email for SharePoint. Images can also be added to any attachments in the message. Email HTML — HTML code is converted into text. Email Links — Hyperlinks and internal links can be added to an email message in Aspose.Email. You can also add the email as attachment to other emails. What's New In?

This component helps you integrate e-mail messages into your application and convert e-mail messages from one format to another. With Aspose.Email for SharePoint you can: \* Convert different formats of EML messages to Microsoft Outlook and convert EML and MSG files to different formats. \* Convert different formats of e-mail messages into different formats. \* Generate mail merge requests for your Outlook clients. \* Merge EML and MSG files into a single file. \* Convert e-mail messages from one format to another. In this tutorial, we will see how to create new table from excel sheet, how to modify/change the cells of the table created. A data table is a grid of rows and columns. In Excel, a table is created by dragging the table from the toolbar in the Workbook window and dropping it in any cell in the desired location. A table can have additional headers, and rows can be placed horizontally or vertically. The table can be modified easily, just double-click the cell or the row you want to modify and then select the desired options. How to create new table in Excel from Excel Sheet If you want to create new table in your excel sheet, then you need to follow below steps. From Excel Menu, select “Office Button” -> “Excel Options”. In the Excel Options dialog, select “Add-Ins”, and then select “Manage”. In the Manage dialog, select “Add-Ins” and select “Aspose.Data.Excel.Interop.Add-in”. This will add the Aspose.Data.Excel.Interop.Add-in in the list. Select “Aspose.Data.Excel.Interop.Add-in” from the list and then click on “OK”. On the right side, click on “Tools” tab. On the left side, select “View Code”. The Aspose.Data.Excel.Interop.Add-in will appear on the form. Now, make the changes in the code. Suppose you want to create a new table, then you can insert below line of code in the addin code. Aspose.Words.Document document = new Aspose.Words.Document(FilePath); 1 Aspose.Words.Table table = document.Tables.Add("New table"); In this line of code, first of all we are opening the document and then adding new table in the document. After that, you need to specify the name of the table. Now, make the changes in the code, suppose you want to

---
