In the United States, AutoCAD's license costs for use in the workplace are approximately \$3000 for an annual personal license and \$50,000 for an annual subscription. AutoCAD is also available in an "all-in-one" edition at a cost of approximately \$3,100. AutoCAD LT (also called AutoCAD Basic) is a free version of the software developed for education purposes only. Available to download and use for free, AutoCAD is not intended for construction, engineering, and fabrication design applications.

History When AutoCAD was introduced in the 1980s, it was revolutionary because it was the first non-fractured graphics computer-aided drafting (CAD) software to be developed specifically for the desktop. AutoCAD was one of the first independent drafting applications, developed by a company from all over the world: Jan Tiwara and his team in Japan, Don Blake and his team in California, and Larry Robinson and his team in Massachusetts, all operating under the umbrella of Autodesk. At the time AutoCAD was introduced, the market for CAD on the desktop was dominated by large manufacturing companies such as Ford, General Motors, and Boeing, each of which had many users of design, modeling, and drafting applications, and each of which owned mainframe computers for CAD on the desktop. In 1982, the Autodesk team of designers, programmers, and graphics specialists began development of AutoCAD. The first version of AutoCAD was first released in December 1982. The development and success of AutoCAD, more than 30 years later, is a testament to the power of Autodesk and its employees, who have continued to innovate to make AutoCAD more useful and easy to use. In the 1990s, AutoCAD began to be used on the web, using the browser-based web app. The first web versions of AutoCAD were made available in 1994. Today, AutoCAD LT is a free web app.

The announcement of the Hackathon had to have been timed perfectly. On the same day that Federer was upset by Andy Murray, the announcement of the first Big Data Social Hackathon (in the San Francisco Bay Area. Since then, we have been blowing up with excitement. We have seen hundreds of registrants from every corner of the world. We have seen over 1000 people sign up for the online registration portal and we have a fairly good idea of where the global population of hackers stands. For my post, I will be looking at how the data from the online registration portal is structured and what tools can be used to help model the data. On the Online Registration Portal The first thing I wanted to do was to figure out how to get the data. I was pretty sure that the data was structured like this, but I wanted to confirm my thoughts. I spent about an hour trying to figure out how to get at the data. While the data is public, you have to create an account and prove your legitimacy. Then you have to fill out a bunch of forms with the non-required data you want. I even asked the organizers of the event for their permission to just download the data. But they just wouldn't let me. I should note that the organizers also have access to the data. This leads me to think that the data is likely structured in a way that is suitable for common analytics tools. So what can we do with the data? There are two main tools that I am using. First, R. R is a general purpose programming language that is used for statistics and data mining. This means that it is well suited for a wide range of data analysis. R is also pretty good at manipulating and analyzing tabular data. Using R, you can easily generate a summary of the raw data by sampling, computing a single statistic, transforming the data, creating charts, etc. The second tool I am using is Tableau. Tableau is a data visualization tool that is built on top of R. This means that you can do a whole range of common analytics in Tableau and then export the results back to R for further analysis and exploration. Thoughts on what a human rights activist for Gay, Lesbian, Bisexual, Transgender, and Queer issues needs to know and be able to do. Wednesday, August 13, 2012 How does discrimination violate human rights? This is from the United States (and Australia, it's here as well) and the underlying definition of human rights includes the right to equal treatment under the law, and the right to not be discriminated against. I suppose there's no one way to do this. I would argue that discrimination (when it's openly stated) is at its worst when it violates a legal right, and in cases like this, where the person who's being discriminated against is allowed to challenge the violation, they could also be heard to argue that they have a right to be protected from discrimination. However, I'm not going to attempt to write a post on just the definition. I want to have a look at some examples to see how it's done in practice. Let's start with some basics. We all know what discrimination means, but let's be clear. It's not just when someone treats someone else differently because of who they are. Discrimination can be subtle. It can be something as simple as not wanting to be around someone who's dressed differently. Let's look at another example of a kind of discrimination that seems obvious to most people. It's pretty well known that young people of all races can get into trouble with the law for being in the wrong place at the wrong time. And that's not something they choose to do, but they are discriminated against because of their age. In many countries, it is illegal for an employer to fire someone because they're under a certain age. It's pretty much illegal to do it in many places (including some states in the US, where employers are restricted from doing it) and this is supposed

to be an example of how the person can be discriminated against. But, in all countries, it's illegal for an employer
