13Fasting bone
metabolism in mice. In

order to study the effect of body weight on the metabolism of bone during fasting, we used an inbred strain of mice. When fasting mice were fed, serum calcium level and the tibia Ca: P ratio were decreased in proportion to the degree of body weight loss. On the other hand, urinary Ca, pyridinoline, deoxypyridinoline and

hydroxyproline were unchanged in fasting mice. The urinary calcium excretion was significantly reduced during fasting and increased during refeeding. On the other hand, urinary deoxypyridinoline excretion was increased significantly in refeeding. Bone histomorphometry revealed that the active

mineral apposition rate was reduced slightly in fasting mice, but was unchanged in refeeding. However, the resorption surface per bone surface was elevated in fasting mice, but decreased significantly
