Unless you're used to editing photos, I'd suggest using Photoshop to edit photos instead of Photoshop Elements – unless you really need a dedicated photo editor. As the software is more powerful, it may seem overwhelming. Any of the features that are specific to Elements are flimsy. It's great for small changes, but it doesn't have the ability to really put the time and effort into a design. This means that you can make using your phone as easy as using your MacBook, whether you're on the go or working in a loud coffee shop. It's certainly not the easiest tool to learn, but once you get the hang of it, it's pretty great. You'll notice the new script format in Creative Cloud, too. This system translates a great deal more cleanly into a native scripting architecture in version CC. But I'm getting ahead of ourselves.

People who closely follow the market have, almost from the beginning, started to wonder whether Adobe is failing. These days it would be hard to from the outside – for example via Facebook – to find an editor passionate about Photoshop that would dispute the current success of the application. It has always been a question whether Photoshop was simply a successful marketing ruse or it really enjoyed the status of being the top image editor. Today Adobe announced that they have been frequently asked by clients to share a more coherent vision of the application and to shed a light on its success. Additionally, companies are constantly seeking ways to integrate the application and give it better exposure.

Adobe realizes that the success of Photoshop means people love the tool, and they do not want to wake up every morning to edits. This is why they have created a strong advertising campaign. But in addition, Adobe aims to solve some problems, which in some way, are not yet perceived as a problem. This summer, Adobe is making another effort to broaden the audience that actually uses the application for creative work.
