This new version is a giant step further than the ones before. There is a huge update of the layer management and the procedural possibilities are unlimited. If you work with bitmap images, then the layer possibilities are amazing. Also, the amount of options for the artist is extremely vast. With compressed tools, you really can't do more than you do now. New features are rewritten in ways that take a while to see. For example, the addition of simplified drawing tools. Also, I believe there is some interesting stuff, particularly for non-linear processing - still being used in the videos industry. Unfortunately, all the software being used here requires an MBA, is more than 10 years old, and even some '85 software. Given that presentation package, the invitation could not have been more full of disappointment. The biggest thing missing from the software is the true bookmaking. Layout and design as practiced within the skills of a professional book designer and made available at a time when no one had it. Is that any wonder? No one is available or willing to teach them what they need to know. But then, what do we expect? I have given them all the tools, and I have helped them or funded books to teach them. That is a reasonable request that I'm afraid they will never grant. We are locked into their model: "Here is the tool, use it. It works, so do it as I tell you to do it." I have similarly asked that they make a plug-in for the software so that the book designer can seamlessly import a print layout and translate it into the digital format with layer and definition. No, they will never do that. It is contrary to their corporate philosophy. So, I compile everything together for a format that I create. But, time after time, we find revisions of the Digital Asset Management (DAM) software that cannot support what we have been doing all along. It is worse than Lulu and it is just ludicrous. They see our business model. They see how it works. They know we are not publishing all of the raw materials. They are willing to destroy our entire business model with a single stroke of their keys. Suspicious? Well, strangely enough, their software is inconveniently free-of-charges. Why would they be willing to abandon their own businesses for the sake of saving you some \$?

Getting your colors just right is one of the most important elements of web graphic design. You want a cohesive color palette throughout the site. You want your colors to stand out, but not dominate and distract from the rest of the design. You want them to be bold, but not overpowering or grotesque. So what's your best strategy for achieving great colors in web design? Is it by color theory or the colors you're most familiar with? Generally speaking, you want a color scheme that's accurately harmonious with the subject of your design and smoothly falls into place with the overall color palette. Of course, if you're a true web graphic designer, you'll want to use color principles, contrast, and color harmony.
